

Module-2

Session-1

Q1. Write a short paragraph in your own words defining what a 'program' is and give one real-life example from any app you use daily (like Instagram , Zomato , or Paytm).

Ans. A computer program is essentially a highly detailed digital recipe written by humans to guide a computer or smartphone through a specific task. Because technology can't think for itself, a program provides the exact step-by-step logic, calculations, and instructions required to take an input (like a screen tap) and turn it into a useful output (like displaying a webpage).

A great everyday example of this is the "**Search**" **feature on Instagram**. When you tap the magnifying glass icon and type a friend's name, a background program instantly takes your text input, queries Instagram's massive database to find matching accounts, filters them based on who you interact with most, and displays the list on your screen in a split second.

Q2. List three popular programming languages you have heard of, and for each, mention whether it is usually compiled, interpreted, or can be both.
Hint: Think of languages like Java, Python, and JavaScript.

Ans. • Python: Interpreted. It executes code line-by-line, which makes it fantastic for quick testing, data science, and scripting, though it runs a bit slower than compiled languages.

• JavaScript: Interpreted (with a twist). Traditionally, it runs line-by-line directly inside your web browser. Modern browsers now use "Just-In-Time" (JIT) compilation to speed it up, but it is fundamentally classified as an interpreted scripting language for the web.

• Java: Both. Java uses a hybrid approach. It is first *compiled* into an intermediate format called "Bytecode," and then that Bytecode is *interpreted* by the Java Virtual Machine (JVM) on your specific device. This is why Java can run on almost any screen or operating system.

Q3. Draw a flowchart (on paper or using any online tool) for the process of booking a movie ticket on BookMyShow, starting from opening the app to receiving the booking confirmation.

Ans. [START]

Module-2

Session-1

[Choose Movie & Date]

[Select Cinema & Show]

| Are Seats Available | ◀

| ▶ (No) (Choose different show)

| ▶ (Yes)

[Select Seats & Cat]

[Proceed to Pay]

| Payment Successful? | ◀

Module-2

Session-1

Q4. Write down the steps (as an algorithm, using simple numbered instructions) for ordering food on Swiggy — from opening the app to completing payment.

Ans.

1. **Start**
2. Open the Swiggy app.
3. Allow the app to detect your current location or manually enter the delivery address.
4. Browse the list of available restaurants or search for a specific dish.
5. Select a restaurant and add items to the cart.
6. Click on the "View Cart" button to review the order summary.
7. Apply a discount coupon if available.
8. Click on "Proceed to Pay."
9. Select a payment option (e.g., Credit/Debit Card, UPI, Net Banking, Net Wallets).
10. Enter payment credentials and authorize the transaction (e.g., entering an OTP or UPI PIN).
11. **Check Transaction Status:**
 - **If** the payment fails, **then** show an error message and return to Step 9 (Select payment option).
 - **Else** (if payment is successful), deduct the money, send the order to the restaurant, and display the "Order Placed" screen.
12. **End**
